Beta function:

$$B(a,b) = \int_{a}^{b} P^{a-1} \cdot (1-P)^{b-1} dP = \frac{T(a) \cdot T(b)}{T(a+b)}$$

$$\int_{a}^{b} P(\theta|a,b) d\theta = \frac{T(a) \cdot T(b)}{b}$$

Beta distribution:

$$P(\theta \mid \alpha, b) = \theta^{a-1} \cdot (1-\theta)^{b-1} \cdot \frac{1}{\beta(\alpha, b)}$$

proof:

m是該眾試驗成功·欠數 (在虚之前成功、失败祭文)

$$= \frac{(N)p^{m}(1-p)^{N-m} \cdot p^{a-1} \cdot (1-p)^{b-1} \cdot \frac{1}{g(a,b)}}{\int_{0}^{1} (N)p^{m}(1-p)^{N-m} \cdot p^{a-1} \cdot (1-p)^{b-1} \cdot \frac{1}{g(a,b)} d\theta}$$

P是己發生的機率, 0是所有可能發生的 P

$$= \frac{p^{m+\alpha-1} \cdot (1-p)^{N-m+b-1}}{\int_{0}^{1} \theta^{m+\alpha-1} \cdot (1-\theta)^{N-m+b-1} d\theta} \qquad \text{fix } \theta = p'$$

$$= \frac{\int_{0}^{1} \theta^{m+\alpha-1} \cdot (1-\theta)^{N-m+b-1} d\theta}{\int_{0}^{1} \theta^{m+\alpha-1} \cdot (1-\theta)^{N-m+b-1} d\theta} \qquad \text{fix } \theta = p'$$

$$= \frac{\partial_{0} (m+\alpha, N-m+b)}{\partial_{0} \partial_{0} \partial_{0} \partial_{0} \partial_{0}} \qquad \text{fix } \theta = p'$$

$$= p^{m+\alpha-1} \cdot (1-p) \cdot \frac{1}{3(m+\alpha, N-m+b)}$$

-. Posterior follows Beta distribution.
